

Jay gets home from uni and realises he has no idea what to cook for dinner.

He messages his housemate to ask what they need and whether they already have food at home.

With no reply, Jay makes a quick shopping list based on what he remembers.

At the supermarket, Jay wants to finish quickly, so he follows his list and looks for cheap or convenient options.

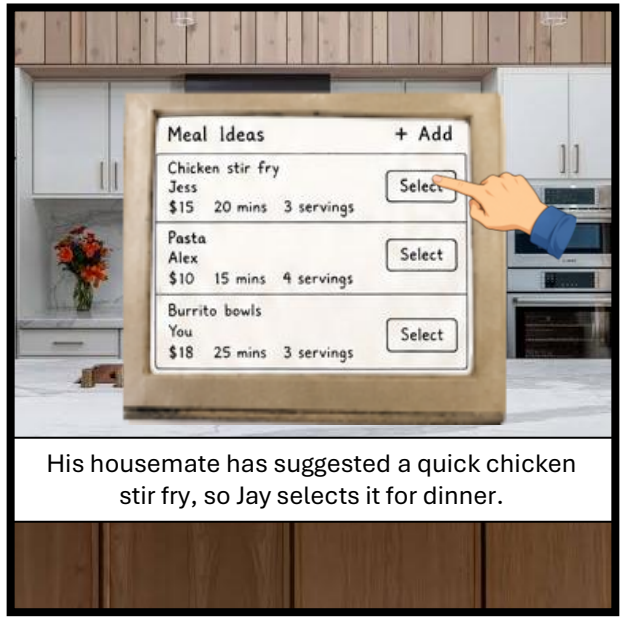

Jay stops when two similar products have different prices and nutrition information.

When Jay gets home, he finds out they already had rice and forgot something his housemate needed.

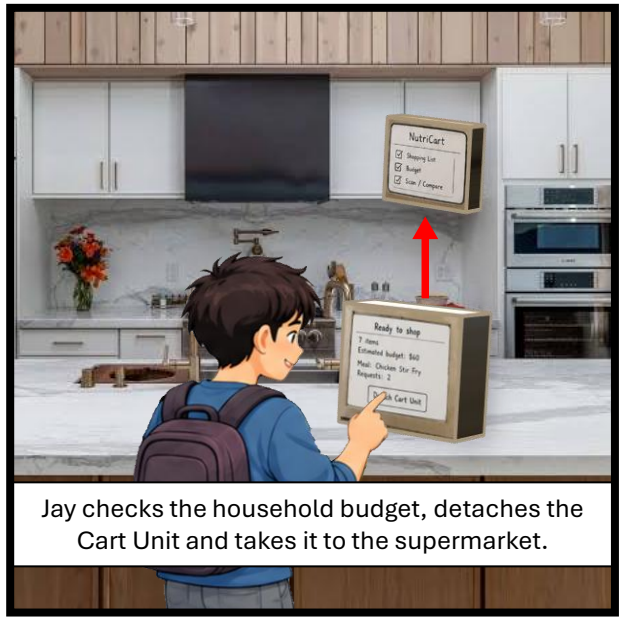

Before shopping, Jay checks the NutriCart Hub in the kitchen.

His housemate has suggested a quick chicken stir fry, so Jay selects it for dinner.

The Hub checks what is already at home and only adds the missing ingredients to the shared shopping list.

Jay checks the household budget, detaches the Cart Unit and takes it to the supermarket.

At the store, the Cart Unit keeps Jay's list and budget visible while he shops.

When Jay is unsure between products, he compares the information that matters to him and finishes the shop without buying duplicates.
