Tuesday week 3 Studio Review

Domain focuses:

*Main focuses

- Healthy habits *

- Fitness *

- Food

- Travel

- Language

Try to find a connection between food and fitness. We're not trying to solve the big problem just trying to find a specific topic that we can work of on and solve.

Example for Ben: "cafe that has lots of bike outside signalling that most of the patrons exercise through cycling on their way to the cafe -> fitness and food"

Breakdown the problem into a very specific problem then we can spread out into the overarching problems that might be causing them.

The Big Questions (from slides)

Problem Space / Domain (what is it? what can it be?)

Domain - specific insights / considerations for design (implication)

Choose a specific aspect of the problem

'Pitch' Social/Mobile Design opportunities (preparation for your presentations)

What to do now for Thursday!

Individually find specific tasks for the fitness and food domain together. How can they be linked and how can we use this to help our project.

Thursday Week 3 Studio Review

Specifying our domain:

-> Sustainable vs healthy choices are not the same and we should look at one specifically

-> "Utilizing social media to influence the food/health choices people make."

-> we need to make sure that we can take the root of the problem and find out things like:

* What actually influences people to make un/healthy or un/sustainable choices?

-This is where we can start to see where the topics for this domain might exist

* Where might be the places that influence a person's habits?

-Shopping for groceries, social media trends, peer influences, social outings, family traditions, cultures, religion, etc.

* Who has influence over these choices?

-Are people fully in control of their habits? Do they have specific dietary requirements, are they financially capable to of having a sustainable/healthy diet, are they only able to eat what is available to them at the time?

Looking ahead (from the slides)

-Discuss/choose a domain within your teams

-Negotiate/plan access for primary research)

-Think of methods to use (research, design, etc.)

Don't need to solve a problem -> identify an area that can be enhanced with social/mobile technology

Things we need to get done:

*Research more into the influences that may cause healthy or sustainable habits (DECO3500 Ideas in Onedrive)

*Narrow down the domain to a more manageable project

*Start on the team charter

Tuesday Week 4 Studio Review

Main Topic:

Interview questions for our topic

Refined domain topic

We are interested in enhancing **healthy food choices for younger university students** taking place when **grocery shopping in person** with the possibilities of social and/or contextual computing.

How does social media effect the choices made when shopping? Is it positive, negative, indifferent?

Miro link: Interview questions for Domains - Miro

From the lecture:

- Interviews should focus on real experiences and stories, not just simple answers like yes or no.
- Look for values -> what people care about and what matters to them.
- Identify problems/problematisations in people's experiences.
- These problems can help guide possible design solutions and should be reflected in our interview questions.
- Focus on people's problems, not specific technologies -> we need to understand the problem at its core and see how technology can be incorporated.
- Ask about social interactions, locations, collaboration, communication, and awareness.

To do:

Research paper and existing products/solutions (if any) that relate to our domain.

Start drafting our powerpoint

Finalise the team charter

Thursday Week 4 Studio Review

Summary of points from the slides:

- **Talk to real users** who know the domain.
- **Do research** and use peer-reviewed papers.
- **Come up with multiple ideas**, not just one.
- Make the idea **social, mobile, collaborative, and context aware**.
- **Use users to help design** and improve your ideas.
- Have a **clear plan** for research, prototyping, and testing.
- **Keep improving your idea** based on what you learn.
- Your **Week 12 project should be much more developed** than your first idea.

Talk form Yves and Tom:

We need to refine our problem space in two sections:

1. The domain space: tom said something like specifically choosing a location “uni students that shop near saint lucia” uni students that live in mt Gravatt.”
2. Going back to the social media aspect of food related choices since we need to “possibilities of social and/or contextual computing” the problem needs to have the impact of social/mobile computing.”

What we need to do:

1. Find two papers for our domain (take a good look at the Future Research section in the paper)

2. Try to find the key points that are missing from the paper to help shape the questions for the interview.

3. Conduct 2 interviews each and keep the transcripts.

4. Then we can use this to help back up the missing points from the papers to shape a design for our project.

We need to start thinking about a idea for our prototype something that we can actually make and test to help our issue (not solve).

Tuesday Week 4 Presentation Review

Feedback:

- What is healthy and what does healthy mean for everyone
- What things may help that aren’t apps
- How can we understand things like people’s needs, specific dietary requirements, religions cultures, things like anotexia, etc.
- Social contexts vs social features
- Ask for feedback in interviews for the app idea
    - But try not to lean heavily on it as a main goal.

Thursday Week 5 Studio Review

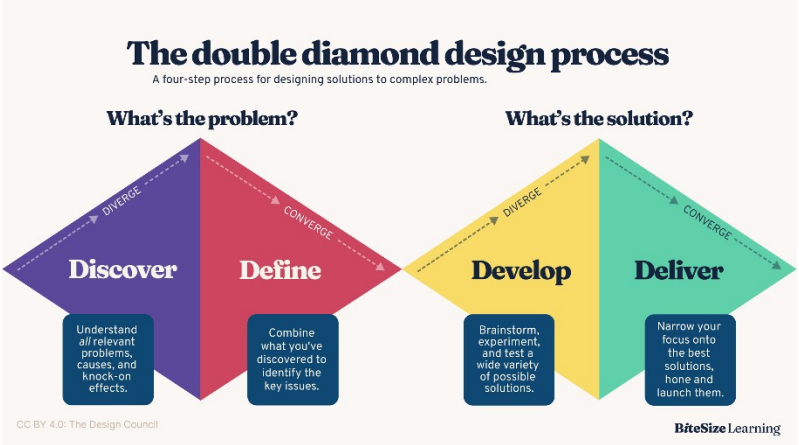

Tutor feedback:

Try to develop a simple prototype for the Social Shopping Companion App something like a quick HTML mockup or a paper design that we can use in interviews to help us understand:

- How the user might interact with it?
- What the difference it between it being there and not being there?
- How it could benefit them or the people around them?

Use the design process to try and improve the plan of work.

- We need to make a more in-depth about how were going to go about working on our project in the coming weeks.

TRY NOT TO MAKE AN APP

- We can use the app mock up to help develop more meaningful research, but it would be better if we didn't make an application.

Remember portfolio tasks:

- We have two → one from last week on ed and the new one this week on the slides.

Tuesday Week 6 Studio Review

Thursday Week 6 Studio Review

From the lecture:

- A framework is a guide, not a checklist - it gives us things worth thinking about rather than steps you have to follow.
- It helps structure a messy design problem and can make us notice things we might have missed.

- Design for Location is useful when the location is an important part of the experience, either because the system uses where people are or because it is designed for a specific place.
- The framework has two main parts (for the miro board activity):

  ➔ Foundation: motivations/aims, inspiration, site, people and resources.
  ➔ Experience: theme/narrative, nodes, trajectory, tools and public face.

- Don't have to use every section. Start wherever makes sense for our project and focus on the parts that are relevant.
- Move back and forth between sections as our design develops instead of treating them as a fixed order.
- The main purpose is to ask better questions about our project, then identifying what we already know, what we assume or what we still need to investigate.

Feedback from tutors:

- Continue to interview people using the app prototypes as a main focus to help find what things work well and what don’t.

  ➔ Interpret this as collecting information from the app but not from the perspective of using the app, but what underlying features work well and what don’t. Like the goal oriented social aspect.

- Tom brought up the fact that we need to consider the demographic that aren’t interested in shopping being a social activity.

➔ Why might that be and how can that influence our project.
➔ His two examples were not shopping with friends since they tend to buy “unhealthy foods” / junk food, and that shopping with a companion might cause the shopping experience to be less efficient or more time consuming then it needs to be.

- Follow up on the git and transfer some of the documents over to the git, weekly updates, tanscripts, prototypes, etc.
- Once we have a good set of interview data we need to pull away the app interface and interpret the underlying feedback from the users.

Tuesday Week 7 Studio Review

From the lecture:

- Social & Mobile (by subtraction): Looks at how technology can be designed by removing or restricting normal features, rather than always adding more. *Camera Restricta* is an example that limits photography in places that are already heavily photographed.
- Tangible Computing: Focuses on using physical objects as interfaces instead of relying only on abstract interfaces like windows, icons, and a mouse. It uses people's existing knowledge

of interacting with physical things to control digital systems. Examples include Curlybot and Reactable.

- Slow Computing: Questions the idea that technology should always make things faster. Instead, it explores how technology can support a better pace and quality of life, giving people more time rather than simply increasing efficiency. Brainball is an example.
- Speculative Design: Rather than simply solving existing problems, it uses design to ask questions and challenge ideas about society. Physical and interactive designs can be used to provoke discussion, criticism, and debate. NippleChair is an example.

Feedback:

Main idea is to simply try and get to go to these people

Thursday Week 6 Studio Review

From the lecture:

Only about the induction, and also the portfolio tasks.

Just get more intervies done and start to develop a prototype for a new idea.

Tuesday Week 8 Studio Review

Miro board feedback (rebuttals/comments), background documentation, use excerpts, bring up where and what stats for interviews. Talk about thematic analysis (how the themes shape the design). How the analysis led to the design implications and the prototypes. Lean more using physical prototypes. Use the prototypes for interviews. What functions did you make that'll make it to the functioning prototype.

What we need to do:

Finish story board

Prototype

Thursday Week 8 Studio Review

Not much feedback from Tom, was happy with the progress we were making. Things that need to be done:

- **user research findings,**
- **a clear set of experience requirements,**
- **at least one early prototype,**
- **early evaluation findings from testing with users (or proxies),**
- **and progress on the functional prototype.**

Stand-up

- Casual presentation
- have the data (interviews, prototype)
- Ben will ask few questions
- Stats (timing)
- where we got the data
- what’s our experience
- how did we analyze the interviews
- showcase the iteration.
- how the analysis came to this design
- User testing
- what progress have you made in the functional prototype
